

DT Scrum cycle Exercise

Phillip Llewellyn

7/19/2021

Decision Tree Scrum Cycle 7

Step 1

- Load data and get summaries

```
data <- read.csv("BankLoan Dataset 2021 - Clean .csv") #HR.csv
#str(data)
data$lead <- as.factor(data$lead)
data$won <- as.factor(data$won)
summary(data)
```

```
##           X.1           X           RefNum           agerange
## Min.      : 1.0    Min.      : 1.0    Min.      :10023467    18-30 : 97

##
```

```
#str(data)
```

Step 2

- Split data into training and testing data

```
# separate the data for an equal split
data_lead_1 = data[data$lead == 1,]
data_lead_0 = data[data$lead == 0,]

#randomize the sampling
set.seed(20)
newDataset_lead_1 <-sample.split(Y=data_lead_1$lead, SplitRatio = 0.35)
newDataset_lead_0 <-sample.split(Y=data_lead_0$lead, SplitRatio = 0.75)

trainData <-rbind(data_lead_1[newDataset_lead_1,], data_lead_0[newDataset_lead_0,])
testData <- rbind(data_lead_1[!newDataset_lead_1,][1:100,], data_lead_0[!newDataset_lead_0,])

summary(trainData$lead)
```

```
## 0 1
## 262 270
```

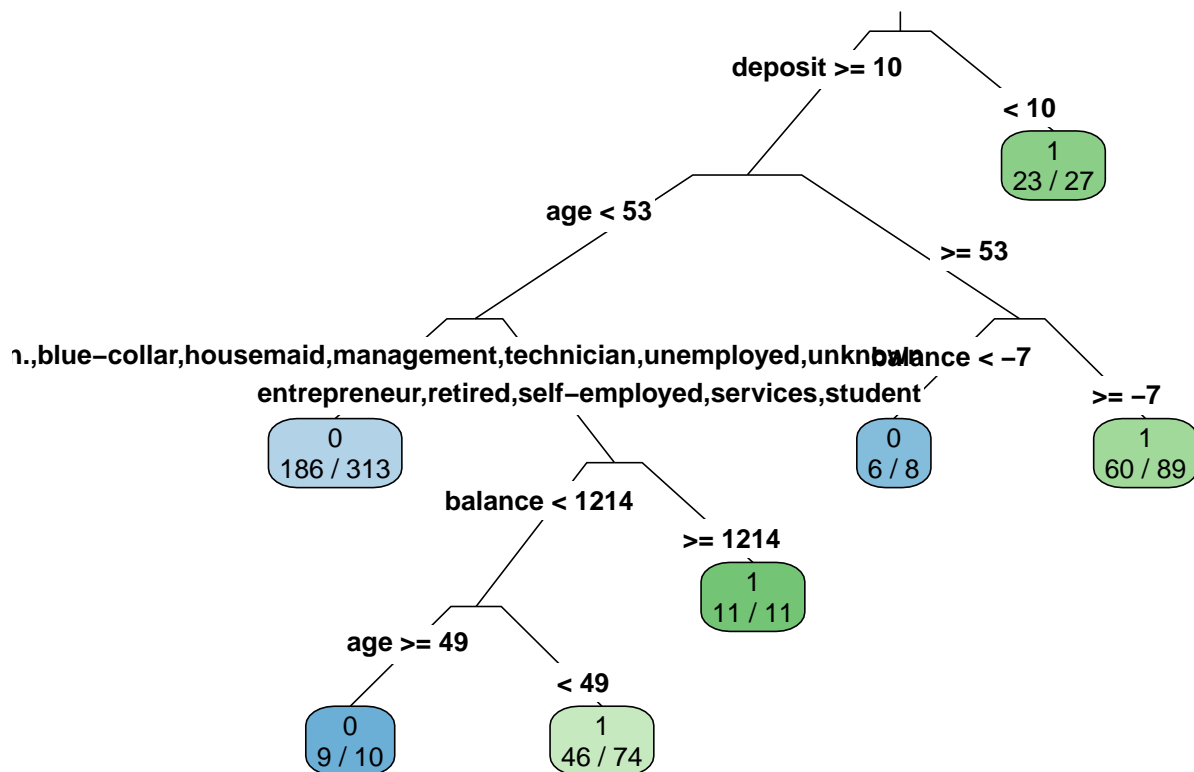

```
summary(testData$lead)
```

```
## 0 1
## 88 100
```

- Fit a Decision Tree using training data

- ```
The . specifies all other columns (Class ~ .)
DTmodel <- rpart(lead ~ education + age + job + marital + deposit + balance + loan + housing)
```

- ```
rpart.plot(DTmodel, type=3, extra = 2, fallen.leaves = F, cex = 0.8)
```

```
#try extra with 2,8,4, 101
```

- 3

```
#(DTmodel) # detailed summary of splits
DTmodel #prints the rules
```

```
## n= 532
##
## node), split, n, loss, yval, (yprob)
##      * denotes terminal node
##
## 1) root 532 262 1 (0.4924812 0.5075188)
##    2) deposit>=10.36 505 247 0 (0.5108911 0.4891089)
##      4) age< 52.5 408 185 0 (0.5465686 0.4534314)
##        8) job=admin.,blue-collar,housemaid,management,technician,unemployed,unknown 313 127 0 (0.594
##        9) job=entrepreneur,retired,self-employed,services,student 95 37 1 (0.3894737 0.6105263)
##          18) balance< 1214 84 37 1 (0.4404762 0.5595238)
##            36) age>=48.5 10 1 0 (0.9000000 0.1000000) *
##            37) age< 48.5 74 28 1 (0.3783784 0.6216216) *
##          19) balance>=1214 11 0 1 (0.0000000 1.0000000) *
##    5) age>=52.5 97 35 1 (0.3608247 0.6391753)
##      10) balance< -7 8 2 0 (0.7500000 0.2500000) *
##      11) balance>=-7 89 29 1 (0.3258427 0.6741573) *
##    3) deposit< 10.36 27 4 1 (0.1481481 0.8518519) *
```

- Run the second model

```
#DTmodel2 <- J48(as.factor(Class) ~., trainData, control = Weka_control(R = TRUE, M = round(NROW(trainD
#DTmodel2 <- J48(as.factor(left) ~., trainData, control = Weka_control(R = TRUE, M = 50))
#IGDT5model <- J48(as.factor(eReader_Adoption)~., trainData ,control = Weka_control(R = TRUE, M = round
#IGDT10model <- J48(as.factor(eReader_Adoption)~., trainData ,control = Weka_control(R = TRUE, M = roun
```

- Plot the model

```
#plot(DTmodel)
```

Step 4

- Use the fitted model to do predictions for the test data

```
predTest <- predict(DTmodel, testData, type="class")
probTest <- predict(DTmodel, testData, type="prob")

actualTest <- testData$lead
```

Step 5

- Create Confusion Matrix and compute the misclassification error

```
t1 <- table(predictions=predTest, actual = actualTest)
t1 # Confusion matrix
```

```
##           actual
## predictions 0  1
##           0 65 53
##           1 23 47
```

```
accuracy1 <- sum(diag(t1))/sum(t1) * 100
accuracy1
```

```
## [1] 59.57447
```

```
#calculate sensitivity
sensitivity <- t1[2,2]/sum(t1[2,]) *100
sensitivity
```

```
## [1] 67.14286
```

```
#calculate specificity
specificity <- t1[1,1]/sum(t1[1,]) *100
specificity
```

```
## [1] 55.08475
```

- Visualization of probabilities

```
hist(probTest[,2], breaks = 100)
```

Histogram of probTest[, 2]

- ROC and Area Under the Curve

```
ROC <- roc(actualTest, probTest[,2])
```

```
## Setting levels: control = 0, case = 1
```

```
## Setting direction: controls < cases
```

```
plot(ROC, col="blue")
```

```
AUC <- auc(ROC)
AUC
```

```
## Area under the curve: 0.606
```

- A new dataframe with Predicted Prob, Actual Value and Predicted Value

```
predicted_data <- data.frame(Probs = probTest, Actual_Value= actualTest ,Predicted_Value = predTest )
#predicted_data$Probs.0 <- Class 0 Probability
#predicted_data$Probs.1 <- Class 1 Probability
predicted_data <- predicted_data[order(predicted_data$Probs.1, decreasing=TRUE),] # Sort on Probability
predicted_data$Rank <- 1:nrow(predicted_data) # Add a new variable rank
```

- plot the graph

```
ggplot(data=predicted_data, aes(x=Rank, y=Probs.1)) +
  geom_point(aes(color = Actual_Value)) + xlab("Index") + ylab("Predicted Probability of getting Diabet")
```

Step 6

- Use model to make predictions on newdata. Note we can specify the newdata as data.frame with one or many records

```
#newData <- data.frame(Nbr_Preg = 4 , Glucose_test = 100, Triceps_SF=40,BP =95, S_insulin = 150, BMI= 30)

#predProbability <-predict(DTmodel, newData, type='prob')
#predProbability

## Performnce measures -
#setseed(1), gini
# Simplicity = 15 leaves
# Accuracy = 0.734
# AUC = 0.7627

#setseed(1), information
# Simplicity = 10 leaves
# Accuracy = 0.71
# AUC = 0.7834
```

Step 7

- EXAMINING STABILITY - Creating Decile Plots for Class 1 or 0 Sort

```

#-----Create empty df-----
#decileDF<- data.frame(matrix(ncol=3,nrow = 0))
#colnames(decileDF)<- c("Decile","per_correct_preds","No_correct_Preds","cum_preds")
#-----Initialize variables
#num_of_deciles=10
#Obs_per_decile<-nrow(predicted_data)/num_of_deciles
#decile_count=1
#start=1
#stop=(start-1) + Obs_per_decile
#prev_cum_pred<-0
#x=0
#-----Loop through DF and create deciles
#while (x < nrow(predicted_data)) {
#  subset<-predicted_data[c(start:stop),]
#  correct_count<- ifelse(subset$Actual_Value==subset$Predicted_Value,1,0)
#  no_correct_Preds<-sum(correct_count,na.rm = TRUE)
#  per_correct_Preds<-(no_correct_Preds/Obs_per_decile)*100
#  cum_preds<-no_correct_Preds+prev_cum_pred
#  addRow<-data.frame("Decile"=decile_count,"per_correct_preds"=per_correct_Preds,"No_correct_Preds"=no
#  decileDF<-rbind(decileDF,addRow)
#  prev_cum_pred<-prev_cum_pred+no_correct_Preds
#  start<-stop+1
#  stop=(start-1) + Obs_per_decile
#  x<-x+Obs_per_decile
#  decile_count<-decile_count+1
#}
#-----Stability plot (correct preds per decile)
#plot(decileDF$Decile,decileDF$per_correct_preds,type = "l",xlab = "Decile",ylab = "Percentage of corre

```
